# PROJECT PROPOSAL

The goal of this project is to build a system using the latest hot technologies! Use multi-touch input devices and advanced analytic graphics and build the most advanced, most enjoyable data exploration application ever. Multi-touch, made popular by the iPhone and iPad, allow for the most natural interactions with applications ever conceived. Data exploration, as a natural task, explore, visualize and repeat is a natural fit and one that fits brilliantly with multi-touch.

Think of this project as building the cool interface from the movie “Minority Report” for exploring business data.

The project team will build:

- An interactive data explorer that will explore multi-dimensional data.
- Users will be able to graph, chart, and explore data with different multi-touch gestures.
- Target audience is business analysis users.
- Client will be written in Silverlight *or* Flash.
- Windows 7 multi-touch devices are a requirement, but other mouse/TUIO devices (large screens) are a design target.
- Data, including hierarchical data navigation, results, and querying available via web services (XMLA). In other words, this is a UI/query app, not a data crunching application.

<b>Figure 1. Datacus Conceptual Overview</b>	<b>1</b>
<b>Figure 2. User Interface Mock-Up</b>	<b>6</b>

# 1 INTRODUCTION

DynamoBI is a start-up with eight employees spread between Seattle, San Francisco, and India. Their core product is an open source business intelligence (BI) database built for analytics, charting, and dashboards. DynamoBI's goal is to create purpose built tools that make business intelligence easy and enjoyable. They are interested in applying new UI technology to discover groundbreaking improvements in the experience of data exploration through multi-touch display interfaces. DynamoBI intends to open-source the Datacus project and use it as a basis for potential future products. DynamoBI's core product and specialty is an open source BI database. This database's sole purpose is analytics, charts and dashboards. Placing the Datacus package in front of their core product will allow DynamoBI to produce a complete solution, because Datacus makes for a perfect demonstration environment for the databases they provide.

A conceptual diagram provided by DynamoBI of the proposed Datacus system can be seen in Figure 1. Datacus Conceptual Overview. The diagram shows Datacus accepting touch input from a touchscreen, which is interpreted by Windows 7 and the TUIO protocol. Datacus also sends and receives data to a Mondrian server, which then retrieves information from an OLAP database selected by the user. The touch events produced by the user manipulate the content viewed and the visual representation of the data in the user's database. By doing so Datacus visually presents the selected information and allows the user to explore data through the interface.

Figure 1. Datacus Conceptual Overview

## 2 REQUIREMENTS

The requirements for Datacus have been broken up into the following sections: Software Environment, Hardware Environment, Performance, Functionality, User Interface, Documentation, and Release. These sections elaborate on the specific requirements necessary for the completed Datacus software project.

### 2.1 Software Environment

---

The Software Environment includes both the software required to develop Datacus and the requirements for a user to run the software.

#### 2.1.1 *Development Environment*

Datacus must be developed using the following environments and APIs:

- Windows 7 Operating System – For development and testing. Also provides the Windows Touch API
- ECLIPSE 3.1.2 – For use with the Adobe Flash Builder 4 plug-in
- Adobe Flash Builder 4 – Adobe’s Flash development environment
- Mondrian 3.2.0 – Pentaho’s open source OLAP engine
- TUIO 2.0 – Touchscreen interface protocol
- 3D visualization APIs (must include at least one of the following):
  - Papervision3D beta 2.0
  - Away 3D V3.5
  - Flash Builder 4 Charts
- Graphing APIs (must include at least one of the following):
  - Flash Builder 4 Charts
  - Degrafa beta 3.1
  - Axiis beta 1.0

#### 2.1.2 *Software Runtime Environment*

Datacus must execute correctly on these platforms:

- Windows 7
- Flash Player 10.1 and above

### 2.2 Hardware Environment

---

The Hardware Environment is a list of the minimum system requirements that Datacus must perform optimally on

- Processor: 2GHz or higher Intel or AMD processor
- RAM: 2GB or higher RAM
- Hard Drive: 1GB available disk space
- Monitor: Minimum 1920x1080 pixel 24-bit color multi-touch display of any size (21” or larger recommended)

- LAN or broadband internet connection to any available OLAP database

## **2.3 Performance**

---

The Performance section lists issues specified for Datacus to perform well on any user's machine.

### **2.3.1 *Start-Up Time***

The time it takes for Datacus to fully load and become operational.

- Less than 30 seconds

### **2.3.2 *Speed***

Datacus reacts instantly to touch.

- Gesture recognition and response:
  - Objects, menus, and items respond immediately to user touch input
  - Calculates data changes and input touches seamlessly with little to no delay
- Server (database) interaction:
  - Although server connection determines speed, a graphical indicator informs the user of server communication and processing
- Graphs:
  - Reloads within a second of receiving the new modified information from the server

### **2.3.3 *Capacity***

How much data and how many users Datacus can support at one time.

- Only one user is supported at a time
- Automatically fetches additional data from the server asynchronously
- Supports exploration of all data stored on the user's database and the creation of charts or graphs based on any cube in the database. A cube is a representation of multi-dimensional data used in an OLAP database

### **2.3.4 *Reliability***

How well the software reacts to normal use.

- Will not crash from normal use (normal use defined as a series of tests designed to ensure the overall functionality of the software)
- Restarts without causing a fatal error after being used for a set period of time and closed by the user (time to be determined later)

## 2.4 Functional

---

The Functional requirements explain how Datacus handles different events. It also explains how the charts and graphs move and what states within Datacus are.

### 2.4.1 *Server Interaction Event Data*

Server Events are defined as Datacus communicating with a database using Mondrian for data extraction.

- Data pulled in from any OLAP server database specified by the user
- Handles as much data as specified by the user

### 2.4.2 *Server Interaction Event Display*

An event display is an indication of the software interacting with a database.

- A server interaction notification icon revolves and changes color as communication with server is occurring
- Stretch Goal: involves some sort of comet animation that when the return updates instead of just changing color back it “shoots” the things on the screen that are going to change

### 2.4.3 *Server Interaction Screen Updates*

A timing and notification update of chart and graph formation from information stored in a database.

- Needs to update information in less than a second after data is retrieved from the OLAP database and loaded into the software
- Visualization indicates when the system is communicating with the server and notifies the user when updates are complete
- The current chart data goes modal and either disappears, is grayed out, or has a refreshing animation happening while the update is in progress

### 2.4.4 *Touch Input Event Data*

Touch events are defined as a user interacting with the software interface using their hand.

- Recognizes touch input and responds to different gestures (to be determined as prototype develops)

### 2.4.5 *Touch Input Event Display*

How Datacus represents that it is registering a touch input from the user.

- A cursor follows single point touches to indicate the system is reacting to the user interaction
- Multiple Point touches indicate gestures that react differently depending on items selected by the user

#### *2.4.6 Touch Input Event Screen Updates*

Indication of touch input from the user including gestures and selection.

- Actions responding to gestures and touch manipulate the system and change the visualization on the user interface
- Items react differently to touch by users such as:
  - Expanding
  - Zooming
  - Selecting

#### *2.4.7 States*

Preferences determined by the user of how to represent data selected from the database.

- Ability to save and upload states of options chosen by the user for viewing data that the user wishes to use later on different data sets
- The outcome is that returning to the previously serialized state object is functionally equivalent to the user having repeated the same set of steps and the outcome/output/visualization should be identical

#### *2.4.8 Chart Motion*

Visual transitions the graphing area should provide as the users change their preferences on how they want to view their data.

- Allows user to grab either the categories panel or series panel and switch their locations on UI to change values from horizontal chart (graph) to vertical chart (graph)
- Able to switch between chart types with gestures (gestures to be determined later)
- Pinch and expand gestures expand the bottom line of chart into multiple or fewer divisions
  - If nothing selected, the system expands the entire chart over time
  - If one item is selected, the system only expands that item

## 2.5 User Interface

The User Interface requirements include lists and descriptions of different aspects of the Datacus software that a user is able to interact with and explains methods in which a user interacts with the system. Figure 2. User Interface Mock-Up shows a bare mock-up of the user interface including the sets, server status, trash can (delete), an expandable picker, the home menu, the graphing area, and the four panels that the user interacts with to manipulate the graphical representations of their data from the user's database.

Figure 2. User Interface Mock-Up

### 2.5.1 General

Basic requirements of the user interface:

- English supported as the primary language
- Targeted toward business users
- Users have a visual reference indication communication between software and database
- Users notified of any diagnostic or run time errors such as:
  - Cannot connect to database
- Home menu includes options that are typically associated with a home menu in a software's interface (exact items to be determined as development occurs)

### 2.5.2 *Gestures*

Input method through multi-touch touchscreen monitors.

- Takes advantage of previous gestures implemented by other multi-touch devices such as:
  - Pinch
  - Swipe
  - Drag & Drop
  - Double Tap
  - Flick
- Includes new gestures that are intuitive to users for manipulating graphical data (gestures to be determined later and require extensive user input and testing to be considered “intuitive”)

### 2.5.3 *Selection*

Method to select data for manipulation:

- Ability to select or deselect single items by tapping on them or tapping multiple items in a sequence
- Ability to grab an entire selected group by dragging one of the selected items

### 2.5.4 *Option Menus*

A menu giving the user the ability to choose and select different options related to objects in the graph.

- Activated by the right click gesture (an extended push, touch and hold)
- Graphically represented by a radial menu to give users options such as:
  - Color change
  - Zoom
  - Drill Down (through data)
  - Drill Up (through data)
- All options to be determined throughout the development process

### 2.5.5 *Trash Can*

Allows users to drag any item, set of items, or panel of items into the trash to remove the information from the visualization.

- Accomplished by “dragging and dropping” selected items into a trash can icon (location to be determined through user testing)
- Should not delay between finger drag and icon (item) drag. Motion should appear fluid on screen
- After removal the server reloads information into visualization to represent a new presentation of the data

### 2.5.6 *Four Panels*

There are four primarily panels required for the user to interact with the system which are described below.

#### 2.5.6.1 Paging Panel

Includes selection for time dimensions and allows users to view progression over a selected time.

- Roulette wheels:
  - Includes a single level, or multiple levels from same or different dimensions
  - Can be Time Dimensions, or other dimensions
  - If multiple levels in the same dimension are selected (say, Year and Month) then moving the Year wheel to 2008 adjusts the Month wheel so it has only the months under 2008. This is similar to the Picker
- Play (go) Button: (ideal stretch for scope of project)
  - Enabled only if one level is selected on paging panel
  - Pressing play grabs all information from the database for the time period and product selected (next 30 objects)
  - Represented as a pause button during processing
    - Include option to go forward and back (frame by frame)

#### 2.5.6.2 Series Panel

Represents information comparable by users (time, profit, etc.).

- Picked from wheel on the Picker
- These are items retrieved from the OLAP database

#### 2.5.6.3 Categories Panel

Comparable items can be dragged onto this bar.

- Picked from child-parent chart inside the picker (see picker description below)
- These are items retrieved from the OLAP database

#### 2.5.6.4 Measure Panel

Represents quantity of numbers.

- Not able to drag items onto this panel
- Should have some way to select which measure to visualize (such as Total Sales, or Average Sale Price)

### 2.5.7 *Picker*

Tool used by user to select items from the database to drag onto the Series Panel and Categories Panel.

- Expands over the graphing area to give the user a central location for deciding what data should be included in the visualization
  - Collapsible animation for both expanding and closing
  - Be expanded and closed by a flicking gesture
- Semi-transparent to allow user to still be able to view the chart/graph under it
- When expanded have a circular “dimension” selection attached to one side (top or side)
  - Allows users to select what categories they want to see about their data
  - Drag these options into the Series Panel, Category Panel, or Paging Panel
  - Able to flip through dimension options by rotating a wheel
    - The categories are attached to the Toolbar
    - When flipping through dimensions, 2D tree updates to new available data
- 2D trees used to allow for choosing what data from the user’s database will be added to the report
  - Only items at the same level of the trees can be chosen for comparison (can’t compare parent and child nodes together)

### 2.5.8 *Sets*

Saved states of Datacus, including graph preferences and selected categories and series.

- Sets Creator:
  - Folders of commonly selected items for visualization data
  - Saves current State of Datacus including Categories, Series, and graph preferences selected by the user for the current visualization
  - Keyboard (virtual or physical) required to save the set as a name
- Sets Manipulator:
  - Expandable menu to allow choosing a previously saved set
  - Editable based on right click equivalent gesture (to be determined later)
  - Paging panel and series panel flip to display all items in the set and the “Picker” expands to allow for adding new items into the set

## 2.6 Documentation

---

These requirements specify the documentation, both documents and presentations, that will be provided and how it will be created.

### 2.6.1 Documents

Files used for describing and planning the development of Datacus.

- Specific content of each document to be determined later
- Development documents: Requirements, Design, Test Plan, Release Notes
- User documents: User References, User Tutorials (Videos and Interactive Walkthroughs)
- Provide PDF, Word Documents, and printed versions of all documents

### 2.6.2 Presentations

Presentations used to report to the project manager, the project sponsor, and a general audience of peers.

- Overview, State of the Project, Final Demo
- All presentations created in MS PowerPoint or Keynote
- Provide PDF and printed versions of all presentations

### 2.6.3 Wiki System

A post-documentation system used to host documentation on Datacus.

- English
- Hosted Documentation and Help Files
- Audiences for documentation: Troubleshooting and Tutorials

## 2.7 Release

---

Release requirements explain issues related to the release and delivery of the final product.

- End-user releases provided as well as open-source code for developer release
- Files made available as .tgz and .zip files via Github
- Documentation distributed via Wiki System and downloaded through Github

### **3 SUMMARY**

This document describes the requirements set for the Datacus software package. This includes requirements related to the development environment in which the software is to be developed, the hardware environment in which Datacus runs, the functionality that the software must provide, performance standards required of the software, user interface requirements specified by the sponsor DyanamoBI, supporting documents that must be written, and the manner in which the software package is to be delivered including the code, the application, and all documentation. This document is expected to evolve as the project progresses and new requirements are specified.
